EDUCATION

- **Bachelor of Statistics**
[Federal university Of Technology, Akure], [Nigeria]
Graduated: [September, 2026],

EXPERIENCE

University of Ibadan Microfinance Bank, Nigeria *Statistics Intern*

June 2025 – October 2025

- **Data Analysis:** Assisted in analyzing large datasets to extract insights and inform decision-making processes.
- **Statistical Modeling:** Developed and validated statistical models to forecast trends and support business strategies.
- **Reporting:** Created comprehensive reports and visualizations to present findings to stakeholders.
- **Collaboration:** Worked closely with cross-functional teams to provide statistical support for various projects.
- **Software Proficiency:** Utilized R and Python for data manipulation and analysis.

PROJECTS

Efficiency of Asymmetric GARCH Estimators for Nigerian Naira Exchange Rates — *Undergraduate Thesis*

Volatility Modeling: Applied asymmetric GARCH specifications (eGARCH, GJR-GARCH, TGARCH) to model exchange rate volatility for the Naira against the USD, GBP, EUR, and CNY.

Model Selection & Diagnostics: Used dynamic AIC-based model selection and post-estimation diagnostics to identify TGARCH under Student-t innovations as the best-fitting model across all four currency pairs.

Tools: R (rugarch, tseries, FinTS, moments, flextable), Quarto.

Spatial Analysis of Climate Extremes Across Nigeria

Dimensionality Reduction: Applied Empirical Orthogonal Function (EOF) / Principal Component Analysis (PCA) to nine ETCCDI climate extreme indices (TXx, TNn, TX90p, TN90p, PRCPTOT, Rx1day, Rx5day, R95pTOT, CDD).

Spatial Interpretation: Produced climatology maps, scree plots, EOF loading patterns, and spatial regression maps of leading principal components.

Comparative Genetic and Agronomic Analysis of Okra and Maize Varieties

Experimental Analysis: Conducted ANOVA, means separation, and genetic parameter estimation (GCV%, PCV%, heritability, genetic advance) across multiple okra and maize variety trials.

Multivariate Analysis: Performed genotypic/phenotypic correlation, path coefficient analysis, cluster analysis, and PCA to identify high-performing varieties and fertilizer treatments.

Tools: R (agricolae package), R Markdown for automated report generation.

Factorial Design Experiments

Design & Analysis: Designed and analyzed 3^2 factorial experiments, including the effect of water temperature and stirring speed on sugar dissolution time, and an artisanal bread optimization study.

SKILLS

- Proficient in statistical software: R/RStudio, Python, SAS, Quarto.
- Time series and volatility modeling: GARCH-family estimators (eGARCH, GJR-GARCH, TGARCH), AIC-based model selection and diagnostics.
- Multivariate and experimental statistics: ANOVA, means separation, correlation and path analysis, cluster analysis, PCA/EOF, factorial (3^2) experimental design.
- Strong analytical and problem-solving skills.
- Experience in data collection, analysis, and automated statistical report generation (R Markdown/Quarto to Word).
